> **DRAFT — NOT FOR SUBMISSION:** peer-reviewed lab4-staging → main merge and final-main verification are still pending.

Lab 4 — Submission Evidence Map (Pre-release Draft)

Student: Thanakorn Soison — 67070507205 — GitHub: @cottonlnwza
Repository: cottonlnwza/toktickit
Current evidence source: integrated Lab 4 feature code merged to `lab4-staging` (through PR #81, merge `a032df1`), plus Issue #70 evidence updates on `feature/lab4-8-release-evidence`.
Status: DRAFT until the required independent `lab4-staging → main` review/merge and post-merge verification are complete. Do not submit this draft as a final PDF.

Answer Part 1

Git Use with Engineering Workflow (10 points). The existing GitHub Project #3 implements Backlog → Specified → Started → PR Review → Fixing (as needed) → PR Review → Done. Feature PRs #71, #72, #73, #74, #75, #78, #79, #80, and #81 were independently approved and peer-merged to `lab4-staging`. This proves the feature-to-staging history, **not yet** the final staging-to-main release.

- Rendered peer-review record with reviewer identity, actual review comments, responses and approvals. Includes only genuine Lab 4 reciprocal reviews of another student's PRs.
- Repository structure, README, and .gitignore.
- **Pending:** peer-reviewed release PR `lab4-staging → main`, Issue #70 Done state, final Project board screenshot and final-main commit history proof.

Answer Part 2

Spec DD (5 points). Rendered Sprint 4 specification describes 23 FRs, business rules, Actions Taken parent-child accountability, four-state Action lifecycle, eight Ticket statuses, server-enforced resolution gate, role dashboard calculations, authorization, optimistic revisions, preservation migration, idempotent seed and Product Definition of Done. API contract and UI contract supply the executable detail. The specification was peer-reviewed and merged in PR #71 **before** the implementation PRs #72 onward; see PR chronology.

The resolution gate requires at least one `COMPLETED` Action in the **current** `workflowCycle` and no `PLANNED`/`IN_PROGRESS` Actions. The Ticket primary owner is distinct from each Action assignee, and only the current assignee may complete that Action. Reopening begins a new cycle; older Actions remain historical. These are approved Lab 4 contract rules, not inferred additions.

Answer Part 3

Test DD and Traceability (10 points). Rendered Lab 4 test plan, 53 scenario IDs and AC traceability links actual unit, API, UI, migration, performance and E2E source files with status. Server Lab 4 tests, client Lab 4 tests, and Playwright Lab 4 tests are browsable.

Integrated release-candidate local verification, 2026-10-31: Server **243/243** tests across 36 files in separately executed non-overlapping groups (Labs 1–2: 42; Lab 3: 136; Lab 4: 55; Lab 3–4 migration/seed: 10), Client **116/116** across 27 files, Lab 4 Playwright **33/33** (desktop/tablet/mobile 11 each), Lab 3 Playwright regression **7/7**, and both production builds passed. Tests with destructive schema setup used an isolated PostgreSQL `_test` database. The 243 server tests were **not** one combined test command. No hosted CI or final-`main` test run is claimed.

Pending: repeat and record required checks from the final peer-merged `main` SHA for full grading evidence.

Answer Part 4

AI Use with Reflection (5 points). Rendered AI-use and reflection document names ChatGPT and the connected coding bridge, selects **10 genuine Lab 4 key prompts** in the Lab 1 template, and includes a first-person reflection about scope discipline, TDD, correcting peer-review blockers, and separating AI suggestions from actual test/review evidence.

Answer Part 5

Working IT Staff Dashboard UI (5 points). The Staff/Admin Dashboard displays backend-calculated unassigned Tickets, my Tickets, my open Actions, Ticket status/IT-priority summaries, and recent or urgent Tickets. Metrics use current authenticated identity, current workflow cycle and active parent Ticket rules; they link to filtered Queue/Detail screens instead of becoming a separate Ticket-management interface. Selected counts were checked against direct PostgreSQL queries in the Issue #67 tests. Dashboard E2E covers metrics, drill-downs, role isolation and retryable failures.

Screenshots: Desktop · Tablet · Mobile. Loading/empty/forbidden/failure behavior has additional component/API/E2E checks documented in tests.md; not every state is separately pictured here.

Answer Part 6

Working Actions Taken UI (10 points). Actions Taken component and Lab 4 E2E flow demonstrate multiple Actions on a Ticket, immutable creation time, current/historical cycles, list/create/edit/reassign, `PLANNED` → `IN_PROGRESS` → `COMPLETED` or `CANCELLED`, required Result/follow-up note, invalid/inactive assignee rejection, Requester read-only restriction and protected API writes. Completed/cancelled/historical Actions cannot be edited. Backend version checks reject stale updates without partial writes. Browser flows operate through authenticated UI/API with the seeded PostgreSQL test database.

Screenshots: Desktop · Tablet · Mobile. They show multiple Action cards and a real field-level validation state; separate negative/race scenarios are supported by API and E2E tests rather than fabricated screenshots.

Answer Part 7

Working Ticket Workflow (5 points). Approved state matrix in the specification covers `NEW`, `OPEN`, `IN_PROGRESS`, `WAITING_FOR_REQUESTER`, `RESOLVED`, `CLOSED`, `REOPENED`, and `CANCELLED`; workflow API tests check allowed/rejected transitions, completed-current-cycle resolution evidence, reopen isolation, requester advisory indication, Administrator parity, and stale revision errors. Ticket resolution E2E provides browser-level proof. Actions Taken audit tests verify append-only Action events and deterministic version ordering; role-appropriate visibility is covered by backend enforcement and requester tests.

Answer Part 8

Working Requester Dashboard and Final Regression UI (5 points). Requester dashboard numbers and recent/attention Tickets are limited to the authenticated Requester's Tickets; ownership is enforced by the backend rather than by filtering another user's data in the browser. Drill-downs lead to My Tickets/Detail with the documented filter intent. Requester dashboard API tests and cross-Requester E2E show isolation. Lab 3 browser regression **7/7** covers authentication/password change, My Tickets/Ticket Detail and Requester continuation, Staff Queue/Detail, role authorization, and Administrator management. Labs 1–3 server/client regression suites also passed as recorded in Part 3.

Screenshots: Desktop · Tablet · Mobile.

Answer Part 9

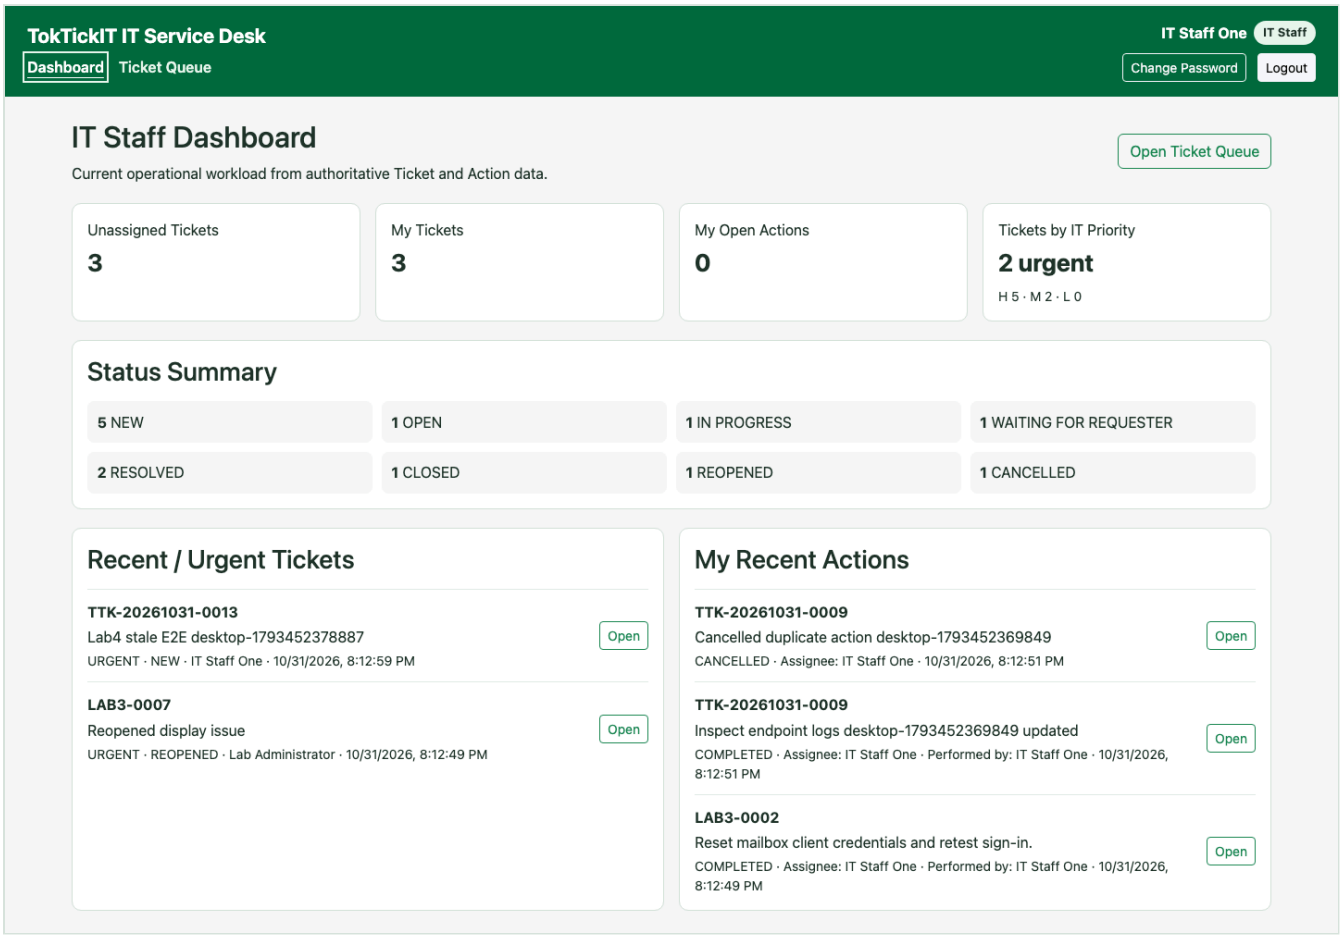

Zen Green UI, Responsive, Accessibility, and Final Polish (5 points). Rendered Lab 4 UI specification and completed visual/accessibility checklist. Browser checks at **1440×900 desktop, 820×1180 tablet, 390×844 mobile** verify no page-level horizontal overflow, hidden required controls or material clipping/overlap on the major screens; visible keyboard focus, field-associated validation, distinct read-only values and non-color status cues are also tested. Visual-hardening browser tests captured all nine real screenshots below.

Major screen	Desktop 1440×900	Tablet 820×1180	Mobile 390×844
IT Staff Dashboard	Image	Image	Image
Requester Dashboard	Image	Image	Image
Actions Taken	Image	Image	Image

Outstanding before final submission: peer review and merge of the Issue #70 documentation/evidence PR, reviewed `lab4-staging → main` release PR and peer merge, all Lab 4 Issues shown Done in the final Kanban, final-main regression/build output, and refreshed PDF screenshots/links if release evidence changes. Do not infer these events from the current draft.
